- Moving colour sequence can be easily re-programmed by changing a single chip, makes regular customers "look again".
- Text/Graphics can be altered by changing the acrylic blade.
- Low voltage 12V no qualifications required to install.
- Line graphics easily implemented.
- Custom Light box extrusion anodized or painted with your colour choice.
- Size from 300mm to 2.4m
- Made by Strident Technology Ltd in New Zealand.

## How they work:

The edge of a sheet of clear acrylic is held in a light box. The computer controlled colour LEDs shine light into the acrylic. The light comes out wherever the acrylic has been routed or painted allowing text and graphics to be displayed.

The text and graphics are displayed as coloured light that appears to float in the air. The computer controls the colour and brightness of the light giving a constant movement to the sign.
